

Evaluation of connected road surface monitoring

Thomas Lundberg and Peter Andrén
Maintenance and operations, VTI

Experiences from two activities

- Activity 2: Comparative measurements, reference and supplier, focus on roughness data
- Activity 3: Comparison of randomly selected sections from supplier fleet measurements vs. reference.
- Participating suppliers, Nira Dynamics (Nira), Mercedes Benz (MB) and Universes (Univ)

Foto: Volodymyr Kalyniuk/Mostphotos.com

Transport administration innovation procurement

Ongoing development during the project

Three main objects to detect

- Winter damage
- Potholes
- Frost heave

Focus of the evaluation has been on evenness measurement and to detect defects/object (potholes, cracks etc.).

Focus has also been on high values/poor condition, sections in need for operation and maintenance.

Foto: Volodymyr Kalyniuk/Mostphotos.com

Variables - reference

- IRI, International Roughness Index – a standardized longitudinal roughness index, wl. 0.5 m to 30 m
- LO, Local Roughness – a national longitudinal roughness index to detect unevenness with a short longitudinal representation (potholes, bridge joints, etc.).
- RMS2, - a national longitudinal roughness index for wavelengths between 1 m and 3 m (used to detect a snowy road surface)
- RMS3, - a national longitudinal roughness index for wavelengths between 3 m and 10 m (minor influence of snow on the road)

All variables can be measured by an ordinary profilometer like the reference, VTIRST we used in the project

Foto: Alexander Marko/Mostphotos.com

Nira Dynamics

Measurement principle – connected vehicle

Evaluated variables

- Estimated IRI – presentation length 25 m – reference IRI – evaluated at 25 m
- Obstacles, Anomalies, extremes – reference local roughness

Foto: Volodymyr Kalyniuk/Mostphotos.com

Mercedes Benz

Measurement principle – connected vehicle

Evaluated variables

- Estimated IRI – presentation length 10 m – reference IRI, evaluated at 20 m
- RMS2 – presentation length 10 m – reference RMS2, evaluated at 20 m
- RMS3 – presentation length 10 m – reference RMS3, evaluated at 20 m
- Surface event – extremes - reference local roughness

Foto: Volodymyr Kalyniuk/Mostphotos.com

Univers

Measurement principle – smartphone

Evaluated variables

- Potholes – geometry/area – Reference Local roughness evaluated at 20 m and visual inspection
- Damage level – overall damage level – Reference visual inspection
- Cracks – geometry - Reference visual inspection
- RMS3 - presentation length 20 m – reference RMS3, evaluated at 20 m

Foto: Volodymyr Kalyniuk/Mostphotos.com

Activity 2

- Data from supplier compared with reference
- Dedicated supplier and reference measurements in Dalarna
- Not necessary the same variable compared between supplier and reference.
- VTIRST used as reference – standard measurement vehicle as used for network road monitoring for the Transport Adm.
- Reference data and position calculated at 1 m level – to enable exact matching with supplier data

Foto: Nils-Gunnar Göransson

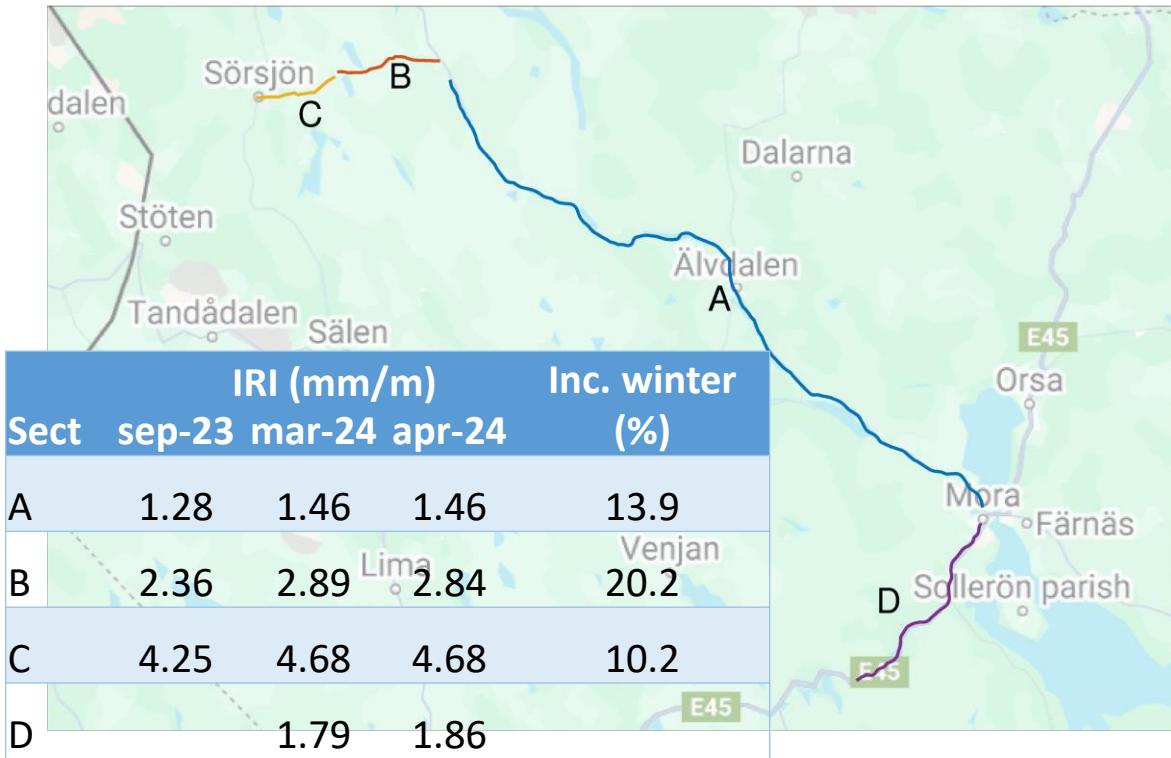

Activity 2 – Test sections in Dalarna

- Four road sections selected
- Three "sessions": 2023/09, 2024/03 and 2024/04.
- Sections A-C measured in all sessions. Section D only in the 2024 sessions.
- Measured twice per session
- A total of 500 km per session for each supplier

Foto: VTI

Activity 2 – Sections A-D

- A: Road W70, 82 km, normal road – rather good standard
- B: Road W1037, 12 km – uneven
- C: Road W1037, 9 km – very uneven
- D: Road E45, 24 km – partly good, partly bad (winter damages)

Three evaluation methods

- **Rank method:** Percentage of supplier data where the rank is within +/- 15% from reference data.
- **Norm(alized) method:** Percentage of normalized supplier data with a minimum absolute difference lower than:
 - 0.5mm/m for IRI, 0.2mm for RMS2, 0.4mm for RMS3, 1.0mm for RMS4.
- **Orig(inal) method:** Percentage of delivered supplier data with a minimum absolute difference lower than:
 - 0.5mm/m for IRI, 0.2mm for RMS2, 0.4mm for RMS3, 1.0mm for RMS4.
- **Use only data where supplier rank is larger than 50% (per section).**

Foto: VTI

Evaluation method – Ranking, limit $\pm 15\%$

- Rank data from 0% to 100%.

Data	Rank (%)
0.52	40.00
4.23	70.00
21.50	100.00
0.47	30.00
0.33	20.00
0.69	50.00
0.03	10.00
14.02	90.00
6.68	80.00
3.29	60.00

Example: Reference ranked 80% - supplier data
"approved" with rank between 65% and 95%

Evaluation method - Normalization

- Make the 10 and 90 percentiles for the supplier data the same as for the reference data.
- Use all available data (not per section).

Aggregated results

Supplier	Index	Type	Rank(%)	Norm(%)	Orig(%)
Nira	IRI	Fleet	59.21	45.89	47.78
Nira	IRI	Testv	60.22	40.86	44.14
Mercedes-Benz	IRI	Testv	84.91	67.86	58.84
Mercedes-Benz	RMS2	Testv	79.88	87.93	87.04
Mercedes-Benz	RMS3	Testv	85.44	81.06	77.52
Mercedes-Benz	RMS4	Testv	56.90	39.60	41.07
Univrses	RMS3	Testv	59.76	56.34	52.45

Foto: VTI

Aggregated results per section

- Mercedes IRI (test vehicle)

Section	Rank	Norm	Orig	Ref. IRI
A	83.48	72.88	62.58	2.16
B	90.84	64.60	49.24	2.84
C	99.67	44.82	19.14	4.62
D	81.41	60.89	65.57	2.34
W. Mean	84.91	67.86	58.84	2.43

- Nira IRI (fleet data)

Section	Rank	Norm	Orig	Ref. IRI
A	54.04	47.96	49.37	1.99
B	70.14	40.42	43.20	2.73
C	97.69	26.18	31.84	4.48
D	57.24	48.83	50.51	2.05
W. Mean	59.21	45.89	47.78	2.25

- Univrses RMS3 (test vehicle)

Section	Rank	Norm	Orig	RMS3
A	56.24	57.57	54.67	1.22
B	71.55	56.03	40.71	1.61
C	83.58	43.56	34.61	2.04
D	57.20	57.05	57.20	1.23
W. Mean	59.76	56.34	52.45	1.32

- Nira IRI (test vehicle)

Section	Rank	Norm	Orig	IRI
A	53.10	41.00	44.36	2.10
B	76.61	44.19	44.85	2.94
C	97.98	34.13	31.55	4.60
D	56.56	43.08	47.03	2.13
W. Mean	59.09	41.19	44.00	2.36

Local roughness

Supplier	REF>99%	REF>85%
Nira	79%	97%
Mercedes-Benz	96%	100%
Univrses	30%	66%

- Nira: Obstacles, all data used
- Mercedes-Benz: Surface Events/Jerks over 25.
- Univrses: Damages/potholes with area over $0.5m^2$. *

Reference is local roughness, +/- 20m from the reported damage.

*Note, universes are detecting potholes, it does not automatically correlate to a rough road.

Summary Activity 2

- Overall good results at aggregated level
- More to analyze/explain/investigate at object level
- A more thorough analysis of data coverage must be done

Foto: VTI

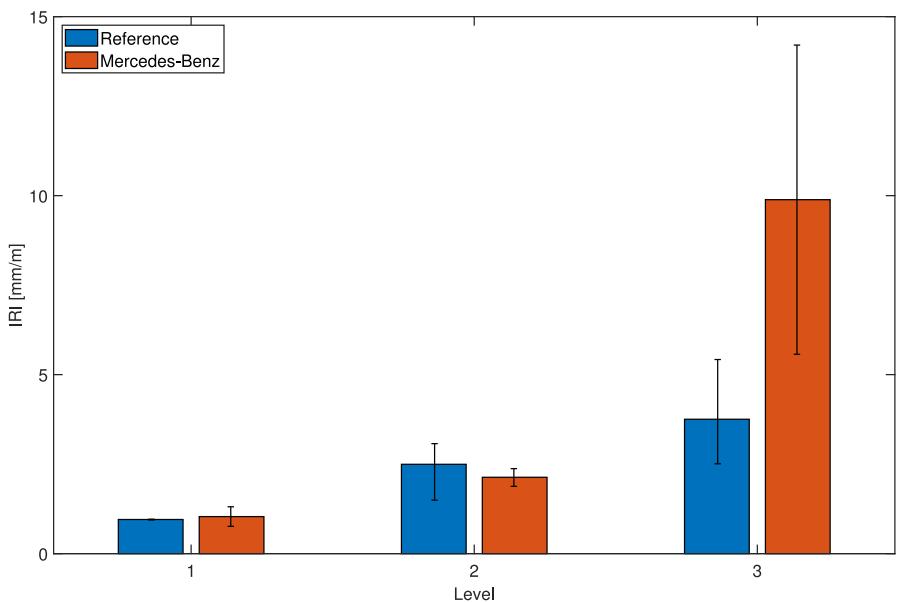

Activity 3

- Comparison between VTIRST (ref) and supplier fleet data
- Access to fleet data from supplier (Dalarna and Gävleborg)
- Randomly selected 10 sections in three categories of supplier fleet data
 - Level 1, 0-50 percentile – some/minor defects, 2 sections
 - Level 2, 75-90 percentile – defects, 4 sections
 - Level 3, 90-100 percentile – severe defects, 4 sections
- The section was measured twice with the reference (VTIRST)

Foto: VTI

Universes – Activity 3

- Data from Gävleborg County
- 1. **Damage level** – Overall road condition - three levels 1 to 3 (no data not damaged)
- 2. **Potholes** – area of pothole
- 3. **Cracks** – geometry of crack
- These features has been compared with visual inspection
- Randomly selected sections has been visually inspected and rated in three levels 1 to 3 – done by Trafikverket.
- Inspection rating, 1 some/minor defects, 2 defects and 3 severe defects

Univrses results – Damage level 3

- Result visual inspection, rating 2, 3, 1, 1
 - Frost cracks and load-bearing damage
 - Edge slump and cracks, generally uneven
 - Old brittle pavement, raveling, poor older repairs
 - Repaired cracks and potholes

Foton: Conny Olsson, Trafikverket

Summary Univrses – Damage level

- Overall good results
- Univrses damage level three was visually classified as worst condition
- One section in damage level 2 without visual damage

Univrses results – Pothole level 3

- Result visual inspection, rating 1, 2, 1, 1
 - Raveling, old paving
 - Potholes in the middle of the road
 - Potholes in the middle of the road
 - Potholes, poor elderly repair

Foton: Conny Olsson, Trafikverket

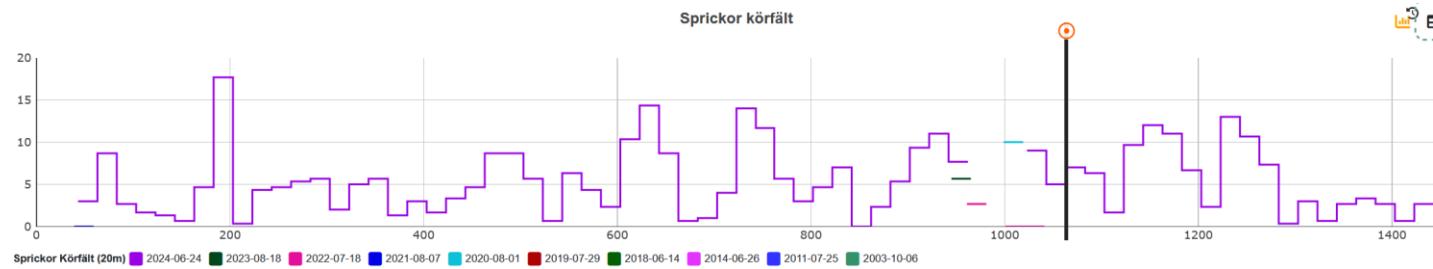

Rating Univrses – Pothole

- Overall ok results
- Not always potholes detected at the sections
- Univrses pothole level 3 had potholes in three out of four sections
- Some sections were affected by road repair

Activity 3 – Univrses – Example Cracks

Visual inspection

PMSv4
